We measured the photon-energy dependence of the parent ion yield over the 8.0-11.5 eV range at a Figure 3 for a particular set of fit parameters. The analysis of the remaining channels is reported as shown in Figure 3 for a particular set of fit channels and is not repeated here. A small error remains in the calibration, which we propagated through the whole reduction chain. The residuals were inspected visually and no outlier removal

The right column carries the second figure of this synthetic page, which is deliberately similar in geometry to the first one so that a naive region estimator cannot tell the two apart.
